

# OpenText™ TrustedLink™ for i

The leading data transformation software for IBM® i

**Communicate easily and securely** across multiple environments

**Improve efficiencies and visibility** with a single point of control

Use the intuitive Visual Mapper tool for **rapid trading partner deployment**

**Accelerate transaction processing** with advanced data management

**Designed and optimized specifically for the IBM i platform, TrustedLink for i converts an organization's internal application data formats to and from the data formats that trading partners require. TrustedLink for i supports enterprise-level volumes of data, as well as those of small companies just starting an EDI program.**

TrustedLink for i simplifies trading partner communications by converting internal application data formats to and from Electronic Data Interchange (EDI) formats or other formats (XML, flat file and CSV) and executing the translation processing between an organization and its business partners.

### **Communicate securely with all trading partners**

Increasingly, trading partners are requiring companies to communicate in multiple environments, including VAN, internet EDI and FTP and to support protocols such as AS1 and AS2 to exchange EDI, XML and other documents. TrustedLink for i integrates seamlessly with OpenText™ BizManager™, which is a gateway for messaging, tracking and auditing business to business transactions. BizManager allows users to meet industry mandates by supporting these and other established standards.

## OpenText: A recognized leader

As the recognized leader for data transformation solutions on the IBM® i platform, OpenText™ TrustedLink™ for i can easily and securely communicate via a value-added network, FTP or over the internet. It can also build electronic trading communities that drive down the costs of business operations and improve customer service. TrustedLink for i is one of the best values on the eCommerce market for large, multinational organizations with thousands of trading partners and for small companies just starting an EDI program.

### Improve efficiencies and visibility

The Transaction Center offers a powerful document management area to access, view and track inbound and outbound documents. From this single point of transaction control, users can administer and monitor all aspects of their trading environment, including acknowledgments, audit trails and reports. Transactions can be easily found or grouped by data contained within the document and organizations can control and customize the display of sensitive data based on users' role access.

### Rapid mapping and trading partner deployment

The Visual Mapper provides an intuitive interface where users can define mapping for standard business documents in the formats they require. The Visual Mapper is easy to use and ensures faster trading partner deployment while helping users deal with complex data mapping requirements. Additional functionality in the Visual Mapper allows users to exchange XML, flat file and CSV-type documents.

### Fast transaction processing with advanced data management

Designed especially for IBM i platforms, TrustedLink for i optimizes the platforms' efficiency and architecture to support enterprise-level volumes of data. Organizations can automate and customize transaction processing to integrate with their business. Advanced archiving options allow aged transactions to be moved to an online Archive Center or to offline storage.

Features	Benefits
Visual Mapper	Reduces integration costs by easily and quickly implementing new trading partners and new transaction sets
Transaction Center	Improves efficiencies and visibility with a single point of control that allows intervention capabilities for expedited exception processing
Purge and Archive Center	Purges obsolete data without interrupting production processing and moves the aged data to a searchable Online Archive and/or stores data indefinitely offline by having it saved to media
